Page 57-60; 87pp. English.

To identify a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solamum tuberosum citrate synthase cDNA (104199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is

Introducing random point mutations into nucleic acods -
by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      C; Gaps
                                                                                                                                                                                                                                                                                                                                                                                               transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                   as a

Random point muttations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to lit to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant. See also P80575.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide probe MK14-A consists of nucleotides 5-95 or MK14 (Q51735). It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59. Sequence 91 BP, 5 A, 17 C, 15 G, 4 T;

This generic forming can also be represented as follows: X(NNB) LICC)(NNB) & INB) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or comprising a TSAR binding domain can be used in vivo to

refusitiving proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a pinding domain and an effector domain.

PS Streening a recombinant vector library expressing fusion proteins by screening a recombinant vector library expressing fusion proteins.

COMPACT STATE TOWN Sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be compacted as follows: X(NNB) (TGC)(NNB)12 (NNB)14 (TGC)(NNB)37. X and Y are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in O70466-68.

COMPACTION OF TASARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and second effector peptide portion that is chancially or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed to that the expressed peptide contains 2 or 4 cysteline residues positioned in or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rigidity to the peptides. The TSARs core companies, comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the company methods of hybridons demanded the end of macromolecules, eg.
                                                                                                                                                                                   943 ICIGATCCTTACCTCTCCTCTTGCTGCTGCTTTGAATGGTTTAGCCGGACCACTTCATGGT 1002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            91 GTTTCGTTGCTGTCAAAGCTCCGCTCTCGAGCGGTCCAACAGTCAAATGTTAGCAATTCT 150

Officially Reagents) Peptides This generate random TSAR (Totally 10765) is a generic DNA sequence used to generate formula can also be represented as follows: X(NNB) GTGO(NNB)12(NNB)14(TGO)(NNB)31. X and Y are flanking restriction sites (X is not the same as Y) that arc not specified further. Other generic sequences are shown in 707466-68.

Other specific peptides generated by these generic sequences are shown in R515-54. TSARs are concatenated heterofunctional proteins or peptides. Generated by these generic sequences are shown in 707466-68.

Offinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligourcleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in or flanking, the unpredicted or variant residues. These residues compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eq. metal ion, calloisotope, peptide, toxin or enzyme, to the specific target or on the monormal or polyclonal antibodies and therefore circumvent the need for contains and the procedic contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      322 CTGTCATTCCTCTTTCCACCAAGAACCATATCAACTGTGATGTTCCCAATTGAACCTT 263

Generic DNA sequence to generate a random TSAR peptide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.

WHI: 94-279/3434.

Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing dusion proteins or screening a recombinant vector library expressing dusion proteins.

PT comprising a binding domain and an effector domain proteins bisclosure; Page 35; 255pp; English.

CT GV469 is a generic DNA Sequence used to generate random TSAR peptide (TGC) (NNB)2(TGC) (NNB)14(TGC)Y. A and Y are flanking restriction sites (X is not the same as Y) that are not specified further. This sequence generates peptides that are cloverleaf in structure. Other of generic sequences are shown in QV465-68. Other specific peptides concatenated by these generic sequences are shown in RG5150-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically criterial regions a realise of so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues positioned in, or flanking, the conformational rigidity to the peptides. The TSARs or compone conformational rigidity to the peptides. The TSARs or compone conformational rigidity of the peptides. The TSARs or compone to in vious moiety, es, metal ion, radioisotope, peptide, toxin of a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, es, metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace of or enzyme, to the specific target or on the cell. They can also replace of conformation of macromolecules, es, monoclonal or polybridoma conformation or in vivo antibody production. The TSARs are easily detained and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      06-007-1998 (first entry)

This sequence represents a human or mammalian DNA replication origin consensus sequences of the invention, designated uniorsconsensus.

Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-conservative replication in proliferating mammalian cells, or inserted into amammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs for defining the essential mammalian elements required for maintenance of chromosomal function. The consensus sequence can be combined with cloned human relomeres and large centromeric blocks for assembly of human artificial chromosomes and maintained as bacterial plasmids, circular or linear, large or small yeast artificial chromosomes (YACS) or as episomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   claim 1; Page 42; 54pp; English.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 9.032; Variance 4.359; scale 2.067

### ALIGNMENTS

Inhibiting citrate synthase (CS) activity in plants - to inhibit flower formation and improve storage capacity, e.g. in potatoes, a lso new CS sense and anti-sense DNA sequences claim 5; Page 15-19; 35pp; German.

Claim 5; Page 15-19; 35pp; German.

C claim 5; Page 15-19; 35pp; German.

C claim 5; Page 15-19; 35pp; German.

C cross of the potato citrate synthase (CS) gene or cDNA sequence encoding CS cross of the plants. Antisense CS sequences are useful for altering CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the plant's storage capacity. This is partic, useful in crop plants cof any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of transgenic plants with altered CS activity. This sequence represents the amino acid sequence of potato citrate synthase. The oligos additionally introduce Bammil cleavage sites at both ends of the amplified cDNA fragment, a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MVFYRSVSLLSKLRSRAVQQSNVSNSVRWLQVQTSSGLDLRSELVQELIPEQQDRLKKIK 60

Synthase, a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (T04199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is given in T04200.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15 SSGLDLRSELVQELIPEQQDRLKKIKSDMKG-SIGNIIVDMVLGGMRGMTGLLWKPHYLD

The DNA can be used to prepare an acetic acid resistant strain bacteria for use in acetic acid fermentation. See also R14358 and 59.

Claim 2; Page 34; 50pp; Japanese.

This represents the amino acid sequence of a Acetobacter xylinum subspecies sucrefermentans bcsA gene product. The invention provides a gene encoding a Acetobacter xylinum subspecies sucrefermentans derived cellulose synthesis complex produced protein. The gene sequence represents bcsA, bcsB, bcsC or bcsD, CMCase and a beta-glucosidase encoding gene. The novel gene and the enzyme participate in the synthesis of cellulose by microorganisms. Cells transformed with the genes may be sequence 754 AA;

four genes, genes A-D. The operon sequence may be used in a transcription vector for the expression of the cellulose synthase operon to increase cellulose production in a recombinant microorganism. This system may be used as an important tool for exploring mechanisms of cellulose synthesis and for enhancing production of cellulose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              155 SLIIMYTTIDALPVTAHPMTQFATGVMALQVQSEFQKAYEKGIHKSKYWEPTYEDSMNL- 213
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           420 plaflffggnijaasplavlayaiphmfhsiata-akv-nkg-wrysfwsevyettmalf 476

                                                                                                                                                                                                                                                             of neurotoxins or psychiatric disorders and to identify compounds which selectively inhibit or activate its action. Antibodies raised against this protein are useful as immunoassay reagents for detecting the protein and as affinity reagents for purification. This fragment of the transporter protein shares homology with the N-terminal domains of the methlenomycin; tetracycline and multi-drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24 dnmlltvvvpivptflyatefkdsnsslhrgpsvssqeenvrigilfaskalmqllvnpf 83
DNA, vectors, transformed cells and antibodies, for diagnosis and treatment of neurological disorders. e.g. Parkinson disease Example 2: Page 114-115; 181pp; English.

The CDNA encoding the chromaffin granule amine transporter protein is useful in gene therapy and as a probe for detecting genomic sequences. The protein is used for screening cytotoxic compounds implicated in Parkinsons disease, diseases associated with activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    claim 50; Fig 1; 79pp; English.

The sequences given in R45000-03 represent the proteins encoded by the bacterial cellulose synthase operon. The sequence given in R45004 is the begining of an open reading frame overlapping the end of this operon. The bacterial cellulose synthase operon contains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of the mouse laminin A chain. The primary object of the invention is to use laminin, laminin-derived protein fragments and/or laminin-derived polypeptides as potent inhibitors of amyloid formation deposition, accumulation and/or persistence in Alzheimer's disease and other amyloidoses. The laminin Broducts (see W50888-98) may include mouse or human laminin A or Al Chain, laminin Bl or B2 chain, laminin A2 chain (merosin), laminin G1 chain, the qlobular repeats of the laminin A1 chain and the beta-amyloid binding domain of the laminin A chain, an employed disease comprises administering a method for treating an amyloid disease comprises administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (AL amyloid), the amyloidosis associated with type II diabetes (amylin or islet amyloid), the amyloidosis associated with type II diabetes (amylin or islet amyloid), the amyloidosis associated with prion diseases including Creutzfeldit-Jacob diseases, Gerstmann-Straussler syndrome, kuru and animal scrapie (PrP amyloid), the amyloidosis associated with long-term haemodialysis and carpal tunnel syndrome (beta 2-microglobulin amyloid), the amyloidosis associated with senile cardiac amyloid and Familial Amyloidotic Polyneuropathy (prealbumin or transthyretin amyloid), and the amyloidosis associated with endocrine tumours such as medullary carcinoma of the thyroid (variant of procalcitonin).
                                                                                                                                                                                                                                                                                                                   Wouse laminin A chain.

A method for diagnosing an amyloid disease involves determining levels of laminin in a sample. Production of laminin or its fourth globular repeat in vivo provides a method for in vivo inhibition of beta-amyloid amyloidosis. The products and methods can be used for the diagnosis, prognosis, monitoring and treatment of amyloidoses such as Alzheimer's disease, Down's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      syndrome and hereditary cerebral haemorrhage with amyloidosis of the Dutch type (where the specific amyloid is the beta-amyloid protein), the amyloidosis associated with chronic inflammation, various forms of malignancy and Familial Mediterranean Fever (AA amyloid or inflammation-association amyloidosis), the amyloidosis associated with multiple myeloma and other B-cell abnormalities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Location/Qualifiers

This sequence is a rat CC chemokine receptor. The receptor can be used
to screen for novel binding compounds and for preparation of antibodies

infection and for diagnosis of H. pylori infection

Claims 14.96; Page 779-779; 1145pp; English.

This sequence is a H. pylori cytoplasmic protein involved in cofactor

metabolism. The protein may be used in a vaccine to prevent or treat H.

pylori infection or to identify H. pylori polypeptide binding compounds,

useful as potential H. pylori life cycle activators or inhibitors. The

DNA and probes derived from it may be used for the identification of

H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic

acid sequences complementary to the DNA act as antisense sequences and

can be used to prevent the translation of H. pylori infection. Nucleic

and distribution of H. pyloris pecific antigens. The genomic sequence of

H. pylori (ATC 55679) was determined from overlapping contigs generated

by mechanically shearing the bacterial DNA. The sequences were analysed

for ORP of at least 180 nucleotides, and the predicted coding regions

cefined by computer evaluation. To identify likely H. pylori antigens for

vaccine development, the amino acid sequences predicted from various ORF

were analysed for significant homology to other known or exported

membrane proteins. Having identified and determined the sequences of

interest, particular regions can be isolated from H. Pylori by 2CR

amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection.

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori plypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic and sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATC. 55479) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for OR of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF

Claim 12; Pages 342-344; 483pp; English.

This sequence represents a Streptococcus pneumoniae protein that, based on homology with an E. coli protein, is a methyl tetrahydropteroyitri glutamate-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antaqonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or I cell immune responses to protect the animal from disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            profeins can also be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenessis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            249 vyadlvnlpvdaigl-dfvegkktlelvkggfpadktlyvgivngkniwrnnyekslavl 307

Tribuly insuration inactivated genes into environment and retrieval and analysis of mutants

Tribuly insuration inactivated genes into environment and retrieval and analysis of mutants

Tribuly insurably for microorganism having a reduced adaptation

Claim 51: Figure 11: 131pp; English.

A method for identifying a microorganism having a reduced adaptation

Claim 51: Figure 11: 131pp; English.

A method for identifying a microorganism having a reduced adaptation

Comprision to a particular environment comprising the insertional inactivation of a gene with a nucleic acid comprising

Tribulative of microorganisms each of a gene with a nucleic acid comprising

Tribulative of microorganisms of the said microorganism; (2) providing

Tribulative sequence for any stored any each mutant produced by step (1) and

Troviding individually stored enceleic acid comprising the unique marker sequence from each individual mutant; (3) introducing a

Troviding individually stored microorganisms which are able to do so

Compress in the said environment; (4) into the said particular environment and allowing those microorganisms; (5) comparing any

Compress in the nucleic acid isolated in step (4) to the marker sequence of each individual mutant which does not contain any

Compress the marker sequence of each individual mutant which does not contain any contain mathor can be used for identify with individual mutant with does not contain and contain mathor can be contain with the marker sequences in the microorganisms of the marker sequences of each individual mutant which does not contain any contain mathor can be contain with the marker sequences in the microorganisms of the marker sequences as isolated in step (4). The products as in step contain mathor and be contained to the marker sequences in the microorganisms of the marker sequences in the micro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 100; DB 19; Length 4473;

The products and methods can be used for identifying virulence genes in microorganisms. The mutant microorganisms can be used in vaccines or to screen for drugs which reduce virulence or compounds useful for preventing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-JAN-1998 (first entry)
Human MIP-1 appha/RANTES receptor.
Macrophage inflammatory protein-1 alpha; MIP-1 alpha;
reduced upon activation normal T expressed and secreted; RANTES;
                                                                         07-13N-1997 (first entry)
Virulence gene cluster polypeptide product.
Virulence gene cluster polypeptide product.
Whitant, adaptation, virulence factor; identification; screening;
Vaccine; drugs; infection: treatment.
Salmonella typhimurium.

PT MIP-1-alpha and RANTES receptor nucleic acid - used to develop products for the detection of these cytokine(s) and their receptors.

PT MIP-1-alpha and RANTES receptor nucleic acid - used to develop products for the detection of these cytokine(s) and their receptors.

PT MIP-1-alpha and RANTES receptor nucleic acid - used to develop products for the detection of these cytokine(s) and their receptors.

PT MIP-1-alpha and RANTES receptor for human macrophage conflammatory protein-1 alpha (MIP-1 alpha) and regulated upon acidiammatory protein-1 alpha (MIP-1 alpha) and regulated upon acidiammatory protein-1 alpha (MIP-1 alpha) and regulated upon acidiammatory protein-1 alpha/RANTES receptor concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or transfected with the nucleic concleotides; a cell transformed or assay for MIP-1a/RANTES in creeptor and polymorphisms in physiological samples. In addition, the coeptor can be expressed and used to assay for MIP-1a/RANTES in creeptor concleotides and prospective usefulness of new antiinflammatory agents.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

##more
part of this sequence, including the amino end of the
mature protein, was confirmed by protein sequencing
This protein is involved in oral morphogenesis preceding binary
fission, and in nuclear events during fertilization, such as
formation of gametic pronuclei and zygote formation of gametic
pronuclei. It also acts as a mitochondrial enzyme, citrate
